

RB-Dag-48
Dagu Servo Controller Shield for Spider Robot Controller

The Heavy Duty servo shield for the Spider controller allows larger servos to be connected directly to the battery or an external power source. A small prototype area is provided for adding additional circuitry such as an amplifier for analog signals.

A heavy duty screw terminal allows better access to the 5V output of the 3A switch mode power supply. The PCB is smaller than the Spider so that it does not block access to the Spiders pins and reset button. This allows a mixture of low power and high power servos to be run from the Spider controller.
